Subject: Sauget Area I DASP

---

Hi Mike

Here are some of my comments, most of which we talked about last Thursday afternoon 3/30/00.

1. It's likely that collecting samples from the yards of the first three residences willing to provide access is not the best scenario; those locations may not provide a representative sample set.
2. There are errors in the Transect Tables and the Sample Location Rationale descriptions; the highest concentrations have not been flagged in the tables for each parameter, so the rationale summaries should be revised to reflect those highest concentrations. (See T1S7 for SVOC, T3S2 for PCB, T3S5 for Cu, T5S6 for SVOC, T6S3 for Zn, T6S5 for VOC)
3. All proposed sample locations for Transect 1 at T1A, T1B, T1C are a considerable distance from the Transect 1 T1S1, T1S2, T1S3, T1S5 locations. Those locations may be OK, but why?
4. Solutia should describe the basis for their proposal and some general justification, such as topography, same side of the street, and/or no other residences in that Transect.
